

SINGLE USE IRRIGATION SYSTEM

Pseudoexfoliation (PEX) syndrome in the eyes is characterized by the accumulation of PEX material in the irido-corneal angle and on the trabecular meshwork. These deposits slowly impede the physiological outflow of the aqueous humor and lead to intraocular pressure (IOP) elevation. Goniowash is a new surgical technique using Tran Goniowash® for clearing PEX material to lower IOP postoperatively.

The Tran Goniowash® is a sterile and single use irrigation device used by physician in controlled environment to clear pseudo-exfoliative particles in the anterior chamber of the eye.

This new instrument is characterized by two distinct water jets separated from each other by a 30° angle. Thanks to the unique design of this device the fluid streams allow a very directional and targeted access to the trabecular meshwork.

TRAN GONIOWASH, TG-01, SPECIFICATIONS

Reference :	TG- 01
Cannula length :	19 mm
Radius of curvature :	25 mm
Outside diameter :	0.8 mm (20G)
Design :	Dr. V.T. Tran

TRAN GONIOWASH, PACKAGING

In a double sterile blister pack ; single use only.	
Packaging :	5 units
Size :	205 x 57 x 45 mm

BENEFITS

- Quick and easy to use according to Goniowash technique (<3min).
- Recovered and creation of the normal physiology flow of aqueous humor.
- Reduces the IOP and hypotensive drug postoperatively.
- No complication according to the study of 190 eyes (Dr. Tran, Dr. Mansouri, Dr. Mermoud).
